Developer for Android Based Platform

Looking for an app developer who would be interested in creating one of the very few types of apps that exist that have a purpose for the user to NOT use the phone. Yes, you read that right. The ideal person would have a strong programming background and experience with mobile Android apps, iOS apps would be a plus. The ability to stick with and complete projects (on deadline) is very important.

This app has a special purpose, and way of working. The way the app functions for the user will be explained in a meeting together during the interview, but the app itself is rather simple. The purpose is to be a strong influence to avoid texting whilst driving, to discontinue procrastination in order to study for that exam or work on a project you have, and it may ease or end one’s addiction to spending all their free time on social media.

This is an application that will replace focus on technology with social interaction, shocking isn’t it? Compensation will be in the form of equity, though some pay may be provided if the situation requires it. We are 100% certain that once fully explained, you’ll be wanting to join our team and take this to a whole new level. How many applications out there are widely used to reduce time spent on your phone? Not many by any means, hence the reason this application is destined to succeed.

And for the requisite bulleted list:

- Strong programming background
- Knowledge of objective C/Swift, C++, JavaScript and HTML 5 a plus but not a requirement to know all languages
- Experience with code-based layout
- Experience with push notifications, stop clock or timers and app submission guidelines a plus
