Abstract:
The Language Acquisition Resource Center (LARC) at San Diego State University has developed various projects to facilitate the process of language learning. The focus of my research is on making a bridge between teachers and students to communicate more effectively on the language learning process. It basically helps teachers to easily upload the language learning videos and add subtitles to them for better understanding. It emphasizes on better language learning and lesser navigation clusters.

Beauty of this application is that it's a very handy tool to simply upload videos and add subtitles to it. Once added it won't be directly accessible by the general users. Once approved will allow the general users, in this case, students, to experience the video learning process. Also users can add comments to a particular video, in a way opening up a new area to connect and share knowledge. Apart from this it also has the ease of navigation, simple to use flow that will not create problems in between for users to navigate through the system. Fairly simple, easy to navigate, upload and add subtitles, and eventually teach students with ease.

This tool is in sync with the LARC's goal to reach teachers and students with tools that will simplify their language learning experience process to be smooth and wealthy.
