**iPhone Application Development**

Our team is looking for someone with iPhone app development knowledge in the Bluetooth Smart (LE) realm. We have a device that transmits data via Bluetooth LE. Specifically, it transmits a number that changes every second. I need an app to run on an iPhone 5 that will accomplish 4 tasks:

1. Pair the iPhone with the device.
2. Display the number the device outputs on the screen
3. Update the screen every time the number changes
4. Log the data in the background for viewing when the app is done running.

If this is something you are interested in and would like to pursue, we can discuss the details of the project in greater detail.

E-mail an estimate of how much you will charge as well as a brief overview of similar apps you have created and we can move forward.

Thank You
Andrew Mudge
