**Location:** SLHS 201  
**Thesis advisor:** Dr Joseph Lewis

### **Abstract:**

With invention of ebooks, especially the invention of eBook reader, eBooks has formed one industry; people's reading custom is changing quietly. The need of providing software with a good user interface for reading eBooks has become essential. In this thesis project we developed a software application called Document Reader Interface. Application interface provides flipping of pages that gives the feel and look of reading from a normal book. DRI has a suite of tools which helps in organizing the structure, size and usability of eBooks. This application also has an administrative panel which helps in performing the CRUD (create, read, update and delete) operations.
